## Today's Class

# Assignment Project Exam Help

- ▶ Portfolio Optimization

- ▶ <https://eduassistpro.github.io>

- ▶ Optimization with constraints

- ▶ Construct the efficient frontier

Add WeChat edu\_assist\_pro

# Harvard Management Company Case Study

Assignment Project Exam Help

- ▶ Today you are the manager of Harvard Management Company, who manages and invests the endowment funds for the Harvard University.

- ▶ <https://eduassistpro.github.io>

- ▶ File `HMC_data.xls` reports relevant info of 12 asset classes: mean, standard deviation and variance-covariance matrix.

- ▶ You'd like to visually explore the data to understand the relationship between risk (standard deviation) and return among these assets.

## Read Data & Scatter Plot

Assignment Project Exam Help

```
1 num, stdev = xlsread('HMCdata.xls');  
2 % read mean, std deviation and covariance matrix  
3 avg_ret = num(:,1);  
4 S  
5 C
```

<https://eduassistpro.github.io>

```
1 figure  
2 scatter(stdev, avg_ret, 40, 'filled'); % 4  
3 % with filled color  
4 title('Scatter Plot');  
5 xlabel('Risk (%)');  
6 ylabel('Return (%)');  
7 xlim([0 25]); % x-axis limits  
8 ylim([0 10])
```

## Scatter Plot

Assignment Project Exam Help

<https://eduassistpro.github.io>

Add WeChat edu\_assist\_pr

# The Investment Decision

- ▶ The scatter plot confirms the traditional finance mantra: Higher risk, higher return.
- ▶

▶ <https://eduassistpro.github.io>

- ▶ Your objective is to find the optimal investment  $w = [\omega_1, \omega_2, \dots, \omega_k]'$  so that your portfolio level is the **minimum**.

- ▶ Meanwhile, sum of your weights equals to 1 as you invest **all** of your capital without borrowing.

## Compute Portfolio Variance

- ▶  $w = [\omega_1, \omega_2, \dots, \omega_{12}]'$  is a column vector ( $12 \times 1$ ) representing weights of capital allocated to different assets.
- ▶  $\Sigma$  is the variance-covariance matrix with size ( $12 \times 12$ )

<https://eduassistpro.github.io>

- ▶ That is, portfolio  $\sigma_p^2$  is a function of the weight
- ▶ The optimization problem is to find the optimal combination  $w^*$  that minimizes the portfolio variance with a **constraint** that sum of the portfolio weights is 1.
- ▶ We term such optimal portfolio as the **Global Minimum Variance Portfolio (GMVP)**.

# Global Minimum Variance Portfolio (GMVP)

- Formulate such portfolio optimization problem as follows:

$$\min \sigma_p^2 = w' \Sigma w$$

<https://eduassistpro.github.io>

$$\mathbf{1}' * w = [1 \ 1 \ \dots \ 1] * \begin{bmatrix} \omega_1 \\ \vdots \\ \omega_n \end{bmatrix} = \omega_1 + \dots + \omega_n$$

- We want to find the optimal  $w^*$  and the corresponding minimized  $\sigma_p^{2*} = w^{*'} \Sigma w^*$

## Optimization: `fmincon`

▶ `x = fmincon(fun,x0,A,b,Aeq,beq,lb,ub,nonlcon,options)`

$$\begin{aligned} A \cdot x &\leq b \\ ( ) \quad Aeq \cdot x &= beq \end{aligned}$$

▶ <https://eduassistpro.github.io>

- ▶ `x0`: the starting point value of input `x`
- ▶ `A, b, Aeq, beq, lb, ub`: elements to define
- ▶ `nonlcon`: the indicator for nonlinear constraints
- ▶ If no specific value used, use `[]` to skip
- ▶ `options`: define for iterations, limits, increments for the optimization process as well as screen display.

## Optimisation: `fmincon`

Assignment Project Exam Help

- ▶ `x1 = fmincon(@myfun(x), x0, ...)` finds the optimal value `x1` that minimizes the result of function `myfun`, with starting point at

▶ <https://eduassistpro.github.io>

- ▶ `[x1, fval1] = fmincon(@ (x) myfun(x,y)`  
as above, but with two outputs

- ▶ `x1` is the optimal value of `x` that minimizes the `f`
- ▶ `fval1` is the minimized value of `m`
- ▶ `fval1 = myfun(x1,y)`

Optimisation: `fmincon`

## Assignment Project Exam Help

- ▶ `x1 = fmincon(@myfun(x), x0, A, b)` specifies the 1st type of constraint  $A \cdot x \leq b$

<https://eduassistpro.github.io>

constraint  $A_{eq} \cdot x = b_{eq}$  only.

- ▶ `x1 = fmincon(@myfun(x), x0, A, b, Aeq, beq)` specifies types of constraints with additional lower and upper bounds, so that the solution is always in the range

Add WeChat: edu\_assist\_pro

## Step 1: Define the Objective Function

- ▶ Going back to our global minimum variance portfolio question

# Assignment Project Exam Help

$$\min_{\mathbf{w}} \sigma_p^2 = \mathbf{w}' \Sigma \mathbf{w}$$

$$\text{s.t. } \mathbf{1}' \mathbf{w} = 1$$

- ▶ <https://eduassistpro.github.io>

# Add WeChat edu\_assist\_pro

```

1 function [pvar] = compute_gvar(cov_mat, cov_
2
3 % w is a column vector
4 pvar = w' * cov_mat * w;
5
6 end

```

## Step 2: Define the Constraint

# Assignment Project Exam Help

$$\begin{aligned} \min \quad & \sigma_p^2 = w' \Sigma w \\ \text{s.t.} \quad & \mathbf{1}' w = 1 \end{aligned}$$

- ▶ <https://eduassistpro.github.io>

Add WeChat  $\begin{cases} \mathbf{1}' w = 1 \\ A \cdot x \leq b \\ A_{eq} \cdot x = b_{eq} \\ lb \leq x \leq ub \end{cases}$  edu\_assist\_pro

- ▶  $A_{eq} = \mathbf{1}' = [1, 1, \dots, 1]$
- ▶  $b_{eq} = 1$

## Step 3: Optimize

```
w1 = fmincon(@(w)compute_pvar(w, cov_mat), w0, [], ...  
[], Aeq, beq, ...)
```

```
1 % constraint: sum of weights is 1  
2 N = length(avg_ret);  
3 A  
4 b  
5 w  
6 % s  
7 o  
8  
9 % option 1: return optimal weight vector w1  
10 w1 = fmincon(@(w)compute_pvar(w, cov_mat), w0, [], [], Aeq, beq, [], [], [], options);  
11 % option 2: return both the optimal weight w1  
12 %           and the minimized portfolio variance pvar1  
13 [w1,pvar1] = fmincon(@(w)compute_pvar(w, cov_mat), w0, ...  
    [], [], Aeq, beq, [], [], [], options);  
14 disp(['The variance of GMVP is ', num2str(pvar1)]);
```

## With Further Constraints

# Assignment Project Exam Help

Add two more constraints to the portfolio variance optimization:

- ▶ NO short-selling is allowed. That is  $w_i \geq 0 \quad \forall i \in [1, N]$ .

▶ <https://eduassistpro.github.io>

Add WeChat edu\_assist\_pro

$$\begin{aligned} \min \quad & \sigma_p^2 = w' \Sigma w \\ \text{s.t.} \quad & \mathbf{1}' w = 1 \\ & 0 \leq w_i \leq 0.2 \end{aligned}$$

## With Further Constraints

## Assignment Project Exam Help

- ▶ Same objective function computation
- ▶ Define the constraints

<https://eduassistpro.github.io>

Add WeChat  $\left. \begin{array}{l} Aeq \cdot x = beq \\ lb \leq x \leq ub \end{array} \right\}$  edu\_assist\_pro

- ▶  $Aeq = \mathbf{1}' = [1, 1, \dots, 1]$ , and  $beq = 1$
- ▶  $lb = [0, 0, \dots, 0]$  and  $ub = [0.2, 0.2, \dots, 0.2]$

## With Further Constraints

# Assignment Project Exam Help

```
1  %% with further constraints
2  % weights with ceiling (20%) and no short sell
3  A
4  b
5  l
6  u
7
8  w0 = ones(N,1)*(1/N); % initial weight
9  w2 = fmincon(@(w)compute_pvar(w, cov_ma
10             Aeq, beq, lb, ub, [], options);
11  [w2, pvar2] = fmincon(@(w)compute_pvar
12             [], [], Aeq, beq, lb, ub, [], options);
13  disp(['The minimised portfolio variance is ', ...
14        num2str(pvar2)]);
```

<https://eduassistpro.github.io>

Add WeChat: edu\_assist\_pro

## With a Target Return

- ▶ Minimize portfolio variance for a given target return 10%

# Assignment Project Exam Help

$$\min w' \Sigma w$$

<https://eduassistpro.github.io>

Add WeChat  $\left\{ \begin{array}{l} A \cdot x \leq b \\ A_{eq} \cdot x \\ lb \leq x \leq ub \end{array} \right.$  edu\_assist\_pro

$$\text{▶ } A_{eq} = \begin{bmatrix} \mathbf{1}' \\ \mathbf{r}' \end{bmatrix}, \text{ and } b_{eq} = \begin{bmatrix} 1 \\ 10 \end{bmatrix}$$

## With a Target Return

# Assignment Project Exam Help

```
1 %% With a target return of 10%
2 A
3 b
4
5 w
6 w
   Aeq, beq, [], [], [], options);
7 [w3,pvar3] = fmincon(@(w)compute_pvar
   [], [], Aeq, beq, [], [], [], options);
8 disp(['The minimised portfolio variance is
   num2str(pvar3)]);
```

## Maximize Sharpe Ratio

- ▶ The portfolio Sharpe Ratio is calculated as

Assignment Project Exam Help

$$\text{Sharpe Ratio} = \frac{r_p - r_f}{\sigma_p}$$

$$r_p = w' \mathbf{r}$$

$$\sigma_p = \sqrt{w' \Sigma w}$$

<https://eduassistpro.github.io>

- ▶ Step 1: Define the function

```
1 function [p_sharpe] = compute_sharpe
2     (cov_mat);
3     w = randn(1, N);
4     w = w / norm(w);
5     pvar = w' * cov_mat * w;
6     pret = w' * avg_ret;
7     % assume risk free rate = 3% annually
8     % 3 as return in percentage
9     p_sharpe = (pret - 3) / sqrt(pvar);
10 end
```

Add WeChat edu\_assist\_pro

# Maximize Sharpe Ratio

- ▶ Maximise the Sharpe ratio allows a relative optimization
  - ▶ For the same level of risk  $\sigma_p$ ,  $\max \text{Sharpe} = \max \text{return } \mu_p$
  - ▶ For the same level of return  $\mu_p$ ,  $\max \text{Sharpe} = \min \text{risk } \sigma_p$

▶

- ▶ <https://eduassistpro.github.io>

$$s.t. \quad \mathbf{1}'w$$

which is equivalent to the following minimization

$$\min \quad -SR = -f(w)$$

$$s.t. \quad \mathbf{1}'w = 1$$

## Maximize Sharpe Ratio

- Put a negative sign - on the `compute_sharpe` objective function: maximization problem into a minimization one:

```
1 %% Maximize Sharpe ratio
2 Aeq = ones(1,N);

3
4
5
6
7 w4 = fmincon(@(w)-compute_sharpe(
    cov_mat), w0, [], [], Aeq, beq, [], [], [
    options);
8 [w4,fval4] = fmincon(@(w)-compute_sharpe(
    cov_mat), w0, [], [], Aeq, beq, [], [], [
    options);
9 % fval4 = -sr1 as the fun = -compute_sharp
10 sr = - fval4;
11 disp(['The maximised portfolio Sharpe ratio is ', ...
    num2str(sr)]);
```

## Construct Efficient Frontier

- ▶ The efficient frontier is the best return vs. risk investment combinations that one can obtain via portfolio diversification on risky assets.

- ▶ All assets that lie on the frontier are the most efficient.

- ▶ <https://eduassistpro.github.io> for a range of target returns.

- ▶ We **exclude Cash** since it is the risk-free asset.

- ▶ Loop through all target return levels, find the optimal weights that minimize the portfolio risk with respect to return.

- ▶ With the optimal weights, calculate the portfolio variance and plot against the target return.

## Construct Efficient Frontier

# Assignment Project Exam Help

```

1 target_ret = 3:0.2:15;
2 M = length(target_ret);
3 p
4 w
5
6 % M
7 f
8 Aeq = [ones(1,N-1); avg_ret(1:end-1)'];
9 beq = [1; target_ret(i)];
10 w_opt = fmincon(@(w) compute_pvar(w, cov_mat(1:end-1, 1:end-1)), w, [], [], Aeq, beq, [], []);
11 pstd devs(i) = sqrt(compute_pvar(w_opt, cov_mat(1:end-1, 1:end-1)));
12 end

```

<https://eduassistpro.github.io>

Add WeChat: edu\_assist\_pro

## Construct Efficient Frontier

# Assignment Project Exam Help

- Plot the efficient frontier

<https://eduassistpro.github.io>

```
